

Drowsy with Depression

by NEWLIFEOUTLOOK TEAM

Your Fatigue in Depression

With a major depressive episode, you likely don't feel like doing anything. You may experience a lack of interest in things that you used to enjoy doing. You should take your medications or participate in therapy and then get out and start exercising. Any form of exercise that you do will activate chemicals in your brain and can help you to feel better. If you exercise outside, you're likely to see an even better increase, especially if you have seasonal affective disorder. Part of the cause of seasonal affective disorder is not getting enough vitamin D and sunlight from staying indoors. Dress warmly and have a walk and pick up a hot drink on the way during the winter.

Some Conditions with fatigue as a symptom

Measuring Fatigue

The **Fatigue Severity Scale (FSS)** is a self-reported questionnaire used to measure your fatigue. It consists of ...

NINE Questions, each rated on a scale of 1-7

To score the Fatigue Severity Scale, either add all items together (this will range from 9-63) or find the mean by adding your items together and dividing by a total will range from 1-9.

In either case, the higher the number you calculate is, the more fatigued you are.

- 1** **Quantity & Quality of Sleep**
 - ✓ Have a regular bed time and wake up time
 - ✓ Use your bed just for sleeping
